

Without adequate changes to how your organization operates, even the best data management software will fail to guide your business toward the competitive advantages of a data-driven culture. Follow this checklist to ensure your data governance efforts are strong and sustainable.

1. Establish a centralized and governable dataset.

Establish a single source of truth for your data, which empowers your analytics teams to deliver their strongest insights while allowing stakeholders across your organization to generate their own reports.

2. Clarify your conclusions through uniform data definitions.

Collaborate across your organization to resolve inconsistencies between teams in how sales and revenue figures are compiled. Document canonical reports and tables to establish a data lineage.

3. Harness a customized software solution to facilitate your management and compliance efforts.

Whether you need to address issues around following financial services best practices or personal privacy protection, you need to build custom architectures to satisfy your regulatory needs. DAS42 can help.

4. Establish a data quality work group composed of cross-functional stakeholders.

Develop the organizational support for a data-driven culture through implementing documentation, training, and support programs for internal stakeholders.

5. Navigate the cultural changes required to ensure your company's long-term success in a data-driven business climate.

Allowing internal teams self-service access to the data that drives your business can be an unfamiliar, uncomfortable transition for many organizations. But you don't have to go it alone. With our expertise in change management consulting, DAS42 can ensure these changes are sustainable.
